HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A reconstruction
of Adriaan Vlacq's tables in the
Trigonometria artificialis (1633)

Denis Roegel

6 December 2010

This document is part of the LOCOMAT project:
<http://www.loria.fr/~roegel/locomat.html>

[The ‘Thesaurus Mathematicus’], the ‘Opus Palatinum,’
and Vlacq’s ‘Arithmetica Logarithmica,’ 1628
and ‘Trigonometria Artificialis,’ 1633,
may be said to be the four fundamental tables
of the mathematical sciences.

Glaisher, 1873 [24, p. 45]

1 Vlacq’s *Arithmetica logarithmica* (1625–1628)

Adriaan Vlacq (ca. 1600–1667) came to be involved in the publication of tables of logarithms through Ezechiel de Decker (ca. 1603–ca. 1647), a Dutch surveyor and teacher of mathematics.

De Decker had the idea of translating a number of works by Napier and others, but De Decker neither had a command of Latin, nor presumably the money to publish the books. As Vlacq knew Latin and had money, they entered a contract to publish a number of works. Two books were published in 1626, the “*Eerste deel van de nieuwe telkonst*” [10], containing several translations, and the *Nieuwe telkonst* [11], containing a shortened version of Briggs’ *Arithmetica logarithmica*, as well as a translation of Gunter’s table of logarithms of sines and tangents. Both books had as their sole author De Decker who announced another more complete work, the *Tweede deel*, which for a long time had seemed never to have been published.

The *Tweede deel* [12] was published in 1627, but only two or three copies of it seem to have survived, for reasons which are still not totally clear, and that we have tried to expose in our study of Vlacq’s 1628 table [41]. It was only in 1920 that the *Tweede deel* was really rediscovered. It contained a table of the logarithms from 1 to 100000 to 10 decimal places.

The same table was republished by Vlacq in 1628, with Briggs’ introduction to his *Arithmetica logarithmica* [6], and without any mention of De Decker’s work or involvement [52]. Between 1628 and 1920, Vlacq was therefore considered as the author of a work of which he was only a participant, albeit one that did a great share of work.

The work on the *Arithmetica logarithmica*, of which he was actually the publisher (with Rammazeyn being the printer), apparently led Vlacq to learn enough mathematics to compute tables by himself.

2 Vlacq’s first trigonometric table (1628)

A large part of De Decker’s 1627 table was computed by Vlacq, as acknowledged by De Decker in his preface [12]. In 1628, Vlacq added a table at the end of the *Arithmetica logarithmica*, containing a canon of logarithms of trigonometric functions. This canon gave the logarithms of the six trigonometric functions to 10 places for every minute of the quadrant. Like Gunter’s table, this table actually gave the values of $10 + \log \sin$, $10 + \log \cos$, $10 + \log \tan$, and $10 + \log \cot$. It does not, however, use a radius of 10^{11} as claimed by Vlacq and copied by others [37, p. 156].

This table extended Gunter’s table which gave the logarithms of sines and tangents to 7 places for every minute [27] and it prefigured Vlacq’s 1633 *Trigonometria artificialis* [53]. It was presumably computed by Vlacq who only needed to compute the logarithms of sines from 0° to 45° . Vlacq explained his method of construction in the preface of the *Arithmetica logarithmica*. He actually based himself on Pitiscus’ *Thesaurus mathematicus* [38], computing logarithms of known sines using the radix method.¹

If $\log \sin \alpha$ has been computed for $\alpha \geq 45^\circ$, then we can use $\log \sin \alpha = \log \sin 2\alpha + \log \sin 30^\circ - \log \sin(90^\circ - \alpha)$ for $\alpha < 45^\circ$ and the logarithms of tangents and secants can be obtained with

$$\begin{aligned}\log \tan \alpha &= \log \sin \alpha - \log \sin(90^\circ - \alpha) \\ \log \sec \alpha &= -\log \sin(90^\circ - \alpha)\end{aligned}$$

Such a method does however lead to an accumulation of errors. Delambre writes that sometimes eight logarithms were used to compute a new one, which causes the last decimal to be sometimes incorrect [13, vol. 2, p. 421].

3 The *Trigonometria artificialis* (1633)

Immediately after the completion of the *Arithmetica logarithmica* (1628), Vlacq must have planned to extend this table and construct a more complete table. This was to be the *Trigonometria artificialis*. This table, completed in 1630 [21, p. 298], was only published in 1633. It gave the logarithms of the six trigonometric functions to 10 places every 10 seconds of the quadrant.

The *Trigonometria artificialis* also contains the logarithms of numbers 1–20000 taken from Vlacq’s *Arithmetica logarithmica* (1628).

3.1 The introduction to the tables

At about the same time as Vlacq, Briggs’ *Trigonometria britannica* [7] was completed and also printed at Gouda in 1633 by the same printer.

Given what Vlacq did with the *Arithmetica logarithmica*, it is not surprising to learn that he also copied almost 50 pages from the *Trigonometria britannica* without giving any credit to Briggs [37, p. 159]. But, as shown below, Vlacq did not copy Briggs’ tables.

In any case, the identity of the introductions may explain why, according to Miller [37, p. 159], there are two slightly different title pages, one where the borrowing of *Trigonometria britannica* is acknowledged, and another where it is not.

3.2 The sexagesimal division

Briggs’ *Trigonometria britannica* (1633) [7] uses a centesimal division of the degrees, and since this is Briggs’ first and only trigonometric canon, there was no prior table by

¹This was also observed by Delambre [13, vol. 2, p. 421], Glaisher [23, pp. 442–443] and Wolf [57, vol. 1, pp. 169–175].

him with a similar division. It is likely that Vlacq took the traditional direction for the *Trigonometria artificialis* (1633) [53], probably without knowing that Briggs would divide the degrees centesimally. We can theorize that Vlacq would have switched to the centesimal division, had he known of Briggs' projects soon enough, but Vlacq had probably learned of it too late for undertaking such a major change in the division of the angles.

Glaisher considered that if Vlacq had done the same in his *Trigonometria artificialis* (1633) [53], the switch to a centesimal division might have been easier [21, pp. 301–302], because all the later tables eventually were based on Vlacq's tables. He was the last person who really could have made the switch to a centesimal division possible.

3.3 The construction of the tables

As far as we are aware, there have been very few investigations into the methods employed by Vlacq to construct his trigonometric tables. Only two articles shed a light in this area, namely Gauss' remarks published in 1851 [18] and Glaisher's further researches spurred by Gauss and published in 1873 [23].

Gauss had a closer look at the trigonometric part of Vega's *Thesaurus logarithmorum completus* [51]. These tables reproduce Vlacq's tables from 2° to 45° , giving the logarithms of the trigonometric functions every 10 seconds. From 0° to 2° , the functions were interpolated for every second by Lieutenant Dorfmund, under Vega's direction.

Gauss noticed "that the tabular results in the sine column were almost without exception equal to the sum of the corresponding tabular results in the cosine and tangent columns." [23, p. 440] However, if each value had been computed independently and correctly rounded, this relation should only hold on average in three cases out of four.² For instance, considering the equalities $a + b = c$, rounding a , b and c will break the relation in certain cases: $0.13 + 0.24 = 0.37$, but $0.1 + 0.2 \neq 0.4$.

Moreover, Gauss observed that Vlacq's logarithmic tangents are the most inaccurate, and that the logarithmic cosines are more accurate than the logarithmic sines. From this, Gauss concluded that the logarithmic tangents had been obtained from the logarithmic sines and cosines. Gauss thought that the logarithmic cosines were more accurate because the interpolation was simpler for them.

In fact, Vlacq explained in his preface how the tables were constructed [23, p. 441], but Gauss failed to notice it, perhaps because he did not have access to Vlacq's original volume and only to Vega's *Thesaurus*.

Vlacq first computed the logarithms of the cosines from 0° to 45° . This was done using the sines given by Rheticus in the *Opus palatinum* (1596) [40] where they are tabulated to 10 decimal places every 10 seconds, the same step as the one used by Vlacq. There are $45 \times 60 \times 6 = 16200$ logarithms and they could have been computed using Briggs' radix method. If these logarithms were computed over a period of two years, they represented about 20 logarithms computed per day, a number which could have been reduced if the computations were split between several computers.

²See Glaisher for a simple justification of this proportion [23, pp. 447–448].

The logarithms of the cosines were then used to compute the logarithms of the sines from 0° to 45° using the formula given above

$$\begin{aligned}\log \sin x &= \log \sin 2x + \log \sin 30^\circ - \log \sin(90^\circ - x) \\ &= \log \cos(90^\circ - 2x) - \log \cos x - \log 2\end{aligned}$$

The logarithms of the tangents were then obtained with

$$\log \tan x = \log \sin x - \log \cos x$$

and the logarithms of the cotangents, secants and cosecants were easily derived from them.

Moreover, Glaisher observed that Briggs' and Vlacq's calculations were independent and that Vlacq did not copy some values from Briggs' *Trigonometria britannica* [7].³ This follows from the fact that the values which are common to both tables are those corresponding to angles multiples of $3'$, and that Vlacq's *Trigonometria artificialis* coincides with the trigonometric values given in Vlacq's *Arithmetica logarithmica* for all minutes, as checked by Glaisher [23, p. 444]. In other words, these values have not been copied from Briggs, and the other values are not found in Briggs' table.

3.4 The 20 first chiliades of the *Arithmetica logarithmica*

In addition to the trigonometric part, the *Trigonometria artificialis* contains a copy of the first 20 chiliades (1–20000) of the *Arithmetica logarithmica*, with an errata.⁴

4 Errors

A number of errors were naturally given by Vega and the erratas to Vega's tables may be useful for Vlacq's tables. A list of errors in Vlacq's 1633 table appears in Delambre's *Histoire de l'astronomie moderne* [13, vol.2, pp. 428–432]. Delambre compared the common values, every $3'$. Some errors in the *Trigonometria artificialis* were also given by Andoyer in 1911 [1]. More recently, an overview of the erratas of Vega's and Vlacq's tables was given by Fletcher *et al.* [16, pp. 919–925].

It is not our purpose to give here a list of all the errors in the original manuscript, but our reconstruction might drive another enthusiast to compile an updated list of all errors in the *Trigonometria artificialis*. As an illustration to the real accuracy of Vlacq's tables, we consider the first twelve values of $\log \sin$, for which the error can reach up to four units of the last place:

³Delambre had also analyzed the accuracy of the *Trigonometria artificialis* [13, vol. 2, p. 423] and concluded that Vlacq had made use of Rheticus' table [13, vol. 2, p. 426], and not of Briggs' table, from which he could have interpolated.

⁴The copy of Vlacq's *Arithmetica logarithmica* from the Complutense University of Madrid is available on *google books* (id: -XR-2oDEb9oC), but it only contains the Latin introduction, the trigonometric supplement, as well as the fragment of the logarithms of numbers which was appended to Vlacq's *Trigonometria artificialis*. This may be the result of a binding error.

5 Vlacq-based tables

Almost all the tables of logarithms published after Vlacq’s *Arithmetica logarithmica* and *Trigonometria artificialis* until the 20th century were based on them, with various corrections, extensions, or simplifications.

As a most curious example, the 1628 *Arithmetica logarithmica* and Vlacq’s 1633 trigonometric table were even used as a basis for the Chinese tables of logarithms published around 1720 [48].

Probably the most popular such tables were those of Vega [2, 15], which went into many editions. Vega’s great *Thesaurus logarithmorum completus* [51] published in 1794 gave the logarithms to 10 places, borrowing them from Vlacq from 1 to 100000, and perhaps from Briggs from 100000 to 101000. The logarithms of trigonometric functions were taken from Vlacq’s *Trigonometria artificialis*, only extending them for the first degree of the trigonometric functions.

6 Structure of the tables and recomputation

The original *Trigonometria artificialis* contains an introduction of 52 pages, followed by a first section of tables for the logarithms of the trigonometric functions. This section is followed by a second one which is an excerpt of Vlacq’s *Arithmetica logarithmica*, but only from 1 to 20000. The last page of that table, for the interval 19951–20000, has been reset and is followed by an errata. This section is actually a leftover from the *Arithmetica logarithmica*, as proven by the signatures of the pages, which have also been reproduced here. The signatures of the first part were not reproduced.

These two tables are reproduced here. The tables were recomputed using the GNU `mpfr` multiple-precision floating-point library developed at INRIA [17], and give the exact values. The comparison of our table and Vlacq’s will therefore immediately show where Vlacq’s table contains errors, and this is of course one of the purposes of this reconstruction. Apart from the change in accuracy, we have tried to be as faithful as possible to

the original tables. Among the slight changes, we mention the uniformization of headers. In the original table, there are sometimes variations from one page to the other and these idiosyncrasies were not included here. A few values have also been changed for a purpose of uniformity. The first logarithms of sines and tangents were 0 in Vlacq's table, and we have written *Infinita* instead, like for the logarithm of the first cotangent. The corresponding differences which had been left empty by Vlacq were also adapted. In the second table, only the first difference was missing and was supplied.

References

The following list covers the most important references⁵ related to Vlacq's tables. Not all items of this list are mentioned in the text, and the sources which have not been seen are marked so. We have added notes about the contents of the articles in certain cases.

⁵**Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but we have not done it here.
